                                                                                                                                                                                                                                                                                                                 ö
                                                     response to an immunogen. The molecular adjuvant comprises a targeting ligand, having binding affinity for a characteristic determinant of an antigen presenting cell (APC), the targeting ligand being functionally
                                                                                    linked to the immunogen, and so binding of the molecular adjuvant to the APC determinant activates the APC, effecting delivery of the immunogen to an antigen presenting pathway of the APC. The present sequence represents a targeting ligand and immunogen, in which the juxa-membrane epitope of human mucin-1 is positioned toward the carboxyl terminus and the C5a analogue is positioned toward the terminus. The molecular adjuvant can be used to produce an immune
                                           A novel molecular adjuvant has been developed for enhancing an immune
                                                                                                                                                                response for protecting against viral and other pathogens or to produce anti-tumour responses. It can also be used for the production of antibodies for use as immunodiagnostic and immunotherapeutic agents. The molecular adjuvant is readily taken up and processed by APCs to provide APC-madaiated immune responses. It can provide for the production of antibodies against a weakly-antigenic or
                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Molecular adjuvant; immune response; immunogen; binding affinity; antigen presenting cell; APC; viral pathogen; anti tumour response; antibody; immunodiagnostic; immunotherapeutic; agonist.

response to an immunogen. The molecular adjuvant comprises a targeting ligand, having binding affinity for a characteristic determinant of an antigen presenting cell (APC), the targeting ligand being functionally linked to the immunogen, and so binding of the molecular adjuvant to the APC determinant activates the APC, effecting delivery of the immunogen to an antigen presenting pathway of the APC. The present sequence represents a specifically claimed targeting ligand and immunogen. The molecular adjuvant can be used to produce an immune response for protecting against viral and other pathogens or to produce anti-tumour responses. It can also be used for the production of antibodies for use as immunodiagnostic and immunotherapeutic agents. The molecular adjuvant is readily taken up and processed controlled to production of antibodies against a weakly-antigenic or
                                                                 novel molecular adjuvant has been developed for enhancing an immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                        region from human CSa anaphylatoxin, which has a constrained backbone conformation (compared to the natural peptide's flexible c-terminal region) comprising a beta-turn. Analoques with type (II or V) and type III beta-turns elicit proinflammatory responses characterised by spasmogenesis, platelet aggregation and neutrophil non-mediated increases of cell membrane (specifically vascular) permeability, or neutrophil polarisation, neutrophil enzyme release and neutrophil mediated increases in cell membrane (especifically vascular) wascular) permeability, respectively.
                                                                                                                                                                                                                                                                                                          The analogues can be used as immune adjuvants for the treatment of immune deficiency disorders, and for augmenting standard immune therapy for the treatment of cancer, without inflammatory side effects. They can also be used to facilitate drug delivery by increasing vascular permeablility, e.g. in the treatment of CNS disorders such as Alzheimer's disease or tumours, and to develophigh affinity C5a receptor antagonists useful as non-steroidal
                 C-terminal analogues of C5a anaphylatoxin - induce e.g. spasmogenesis, platelet aggregation and increases in cell membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                immune adjuvant; immunodeficiency; augmentation; immune therapy; cancer; druq delivery; CNS disorder; central nervous system; Alzheimer's disease; tumour; high affinity; receptor antagonist;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                            present peptide is an analogue of a C-terminal decapeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         constrained backbone conformation; proinflammatory response; spasmogenesls; platelet aggregation; neutrophil; non-mediated; mediated; increase; cell membrane; vascular; permeability; neutrophil polarisation; neutrophil enzyme release; treatment;

C5a anaphylatoxin C-terminal analogue C5a(65-74) Tyr65 Pro71 D-Ala73.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                         The present peptide is an analogue of a C-terminal decapeptide region from human C5a anaphylatoxin, which has a constrained backbone conformation (compared to the natural peptide's flexible C-terminal region) comprising a beta-turn. Analogues with type (II or V) and type III beta-turns elicit proinflammatory responses characterised by spasmogenesis, platelet aggregation and neutrophil non-mediated increases of cell membrane (specifically vascular) permeability, or neutrophil polarisation, neutrophil enzyme release and neutrophil mediated increases in cell membrane (esp.
                                                                                                                        C-terminal analogues of C5a anaphylatoxin - induce e.g. spasmogenesis, platelet aggregation and increases in cell membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                   The analogues can be used as immune adjuvants for the treatment of immune deficiency disorders, and for augmenting standard immune therapy for the treatment of cancer, without inflammatory side effects. They can also be used to facilitate drug delivery by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           smooth

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                  The present peptide is an analogue of a C-terminal decapeptide region from human C5a anaphylatoxin, which has a constrained backbone conformation (compared to the natural peptide's flexible C-terminal region) comprising a beta-turn. Analogues with type (II or V) and type III beta-turns elicit proinflammatory responses characterised by spasmogenesis, platelet aggregation and neutrophil non-mediated increases of cell membrane (specifically vascular) permeability, or neutrophil polarisation, neutrophil enzyme respectively.

The analogues can be used as immune adjuvants for the treatment of
                                                                                                                                                                                                    C-terminal analogues of C5a anaphylatoxin - induce e.g. spasmogenesis, platelet aggregation and increases in cell membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            In a type (II or V) beta-turn specific human foetal artery smooth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     muscle contraction assay, and a type III beta-turn specific neutrophil polarisation assay the peptide had respective EC50 (microm) activities of 0.35 and 2.1, compared to 0.018 and 0.0013
                                                                                                                                                                                                                                                                                                                                                                                                                                          disorders such as Alzheimer's disease or tumours, and to develop high affinity C5a receptor antagonists useful as non-steroidal anti-inflammatory agents.
                                                                                                                                                                                                                                                                                                                                                                                               immune deficiency disorders, and for augmenting standard immune therapy for the treatment of cancer, without inflammatory side effects. They can also be used to facilitate drug delivery by increasing vascular permeability, e.g. in the treatment of CNS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present peptide is an analogue of a C-terminal decapeptide region from human C5a anaphylatoxin, which has a constrained backbone conformation (compared to the natural peptide's flexible C-terminal region) comprising a beta-turn. Analogues with type (II or V) and type III beta-turns elicit proinflammatory responses characterised by spasmogenesis, platelet aggregation and neutrophil non-mediated increases of cell membrane (specifically vascular) permeability, or neutrophil polarisation, neutrophil enzyme release and neutrophil mediated increases in cell membrane (esp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The analogues can be used as immune adjuvants for the treatment of immune deficiency disorders, and for augmenting standard immune therapy for the treatment of cancer, without inflammatory side effects. They can also be used to facilitate drug delivery by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         C-terminal analogues of C5a anaphylatoxin · induce e.g. spasmogenesis, platelet aggregation and increases in cell membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                muscle contraction assay, and a type III beta-turn specific neutrophil polarisation assay the peptide had respective EC50 (microM) activities of 51.1 and 4.0, compared to 0.018 and 0.0013
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 In a type (II or V) beta-turn specific human foetal artery smooth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 disorders such as Alzheimer's disease or tumours, and to develop
high affinity C5a receptor antagonists useful as non-steroidal
neutrophil polarisation; neutrophil enzyme release; treatment; immune adjuvant; immunodeficiency; augmentation; immune therapy; cancer; drug delivery; CNS disorder; central nervous system; Alzheimer's disease; tumour; high affinity; receptor anteaponist;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .;

The present peptide is an analogue of a C-terminal decapeptide region from human C5a anaphylatoxin, which has a constrained backbone conformation (compared to the natural peptide's flaxible C-terminal region) comprising a beta-turn. Analogues with type (II or v) and type III beta-turns elicit proinflammatory responses characterised by spasmogenesis, platelet aggregation and neutrophilon-mediated increases of cell membrane (specifically vascular) permeability, or neutrophil polarisation, neutrophil engine release and neutrophil mediated increases in cell membrane (esp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                C-terminal analogues of C5a anaphylatoxin - induce e.g. spasmogenesis, platelet aggregation and increases in cell membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The analogues can be used as immune adjuvants for the treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           In a type (If or V) beta-turn specific human foetal artery smooth muscle contraction assay, and a type III beta-turn specific neutrophil polarisation assay the peptide had respective EC50 (microM) activities of I.13 and 5, compared to 0.018 and 0.0013
                                                                                                                                                                              constrained backbone conformation; proinflammatory response; spasmogenesis; platelet aggregation; neutrophil; non-mediated; smediated; inforease; cell membrane; vascular; permeability; neutrophil polarisation; neutrophil enzyme release; treatment; immune adjuvant; immunodeficiency; augmentation; immune therapy; cancer; drug delivery; CNS disorder; central nervous system; Alzheimer's disease; tumour; high affinity; receptor antagonist; development; non-steroidal; anti-inflammatory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      disorders such as Alzheimer's disease or tumours, and to develop
high affinity C5a receptor antagonists useful as non-steroidal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Immune deficiency disorders, and for augmenting standard immune therapy for the treatment of cancer, without inflammatory side effects. They can also be used to facilitate drug delivery by increasing vascular permeability, e.g. in the treatment of CNS
                                                                                                                                C5a anaphylatoxin C-terminal analogue C5a(65-74) Tyr65 Pro71.

Analogues with type (II or v) and type III bela-turns elicit proinflammatory responses characterised by spasmogenesis, platelet aggregation and neutrophil non-mediated increases of cell membrane (specifically vascular) permeability, or neutrophil polarisation, neutrophil enzyme release and neutrophil mediated increases in cell membrane (esp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  C-terminal analogues of C5a anaphylatoxin - induce e.g. spasmogenesis, platelet aggregation and increases in cell membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           vascular) permeability, respectively.

The analogues can be used as immune adjuvants for the treatment dimmune deficiency disorders, and for augmenting standard immune therapy for the treatment of cancer, without inflammatory side effects. They can also be used to facilitate drug delivery by increasing vascular permeability, e.g. in the treatment of CNS disorders such as Alzheimer's disease or tumours, and to develop high affinity C5a receptor antagonists useful as non-steroidal
                                                                                                                                                                                                                                                                                                                                                           spasmogenesis; platelet aggregation; neutrophil; non-mediated; mediated; increase; cell membiates; vacular; permeability; neutrophil polarisation; neutrophil enzyme release; treatment; immune adjuvant; immunodeficiency; augmentation; immune therapy; cancer; drug delivery; CNS disorder; central nervous system; Alzheimer's disease; trmour; high affinity; receptor antagonist; development; non-steroidal; anti-inflammatory.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         region from human C5a anaphylatoxin, which has a constrained backhone conformation (compared to the natural peptide's flexible C-terminal region) comprising a beta-turn. Analogues with type (II or V) and type III beta-turns elicit proinflammatory responses
anti-inflammatory agents.

In a type (II or V) beta-turn specific human foetal artery smooth muscle contraction assay, and a type III beta-turn specific neutrophil polarisation assay the peptide had respective EC50 (microM) activities of 0.59 and 2.0, compared to 0.018 and 0.0013

The analogues can be used as immune adjuvants for the treatment of immune deficiency disorders, and for augmenting standard immune the therapy for the treatment of cancer, without inflammatory side ceffects. They can also be used to facilitate drug delivery by increasing vascular permeability, e.g. in the treatment of CNS disorders such as Alzheimer's disease or tumours, and to develop in the finity. CS receptor antagonists useful as non-steroidal anti-inflammatory agents.

In a type (II or V) beta-turn specific human foetal artery smooth muscle contraction assay, and a type III beta-turn specific neutrophil polarisation assay the peptide had respective ECSO (microM) activities of 3.7 and 2.5, compared to 0.018 and 0.0013
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                               region from human CSa anaphylatoxin, which has a constrained backbone conformation (compared to the natural peptide's flexible c-terminal region) comprising a beta-turn. Analogues with type (II beta-turns elicit proinflammatory responses) constrained by spasmogenesis, platelet aggregation and neutrophil non-mediated increases of cell membrane (specifically wascular) permeability, or neutrophil mediated increases in cell membrane (esp. vascular) permeability, respectively.

The analogues can be used as immune adjuvants for the treatment of immune deficiency disorders, and for augmenting standard immune therapy for the treatment of cancer, without inflammatory side effects. They can also be used to facilitate drug delivery by increasing vascular permeability, e.g. in the treatment of CNS increasing vascular permeability, e.g. in the treatment of CNS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
            C-terminal analogues of C5a anaphylatoxin - induce e.g. spasmogenesis, platelet aggregation and increases in cell membrane permeability
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            C5a anaphylatoxin C-terminal analogue C5a(65-74) Tyr65 Pro71 Ala72.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             In a type (II or V) beca-turn specific human foetal artery smooth mascle confraction assay, and a type III beta-turn specific neurophil polarisation assay the peptide had respective EC50 (microM) activities of 17.9 and 5.6, compared to 0.018 and 0.0013
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             C-terminal; human; C5a anaphylatoxin; analogue; beta-turn; constrained backbone conformation; prointlammatory response; spasmogenesis; platelet aggregation; neutrophil. non-mediated; mediated; increase; cell membrane; vascular; permeability; neutrophil polarisation; neutrophil enzyme release; treatment; immunodeficiency; augmentation; immune therapy; cancer; drug delivery; CNS disorder; central nervous system: Alzheimer's disease; tumour; high affinity; receptor antagonist; development; non-steroidal; anti-inflammatory.
                                                                                                                                                                                                                                                                                                                                                                                                                                       disorders such as Alzheimer's disease or tumours, and to develop high affinity C5a receptor antagonists useful as non-steroidal
                                                                                                                                   The present peptide is an analogue of a C-terminal decapeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ;

```
region from human C5a anaphylatoxin, which has a constrained backbone conformation (compared to the natural peptide's flexible C-terminal region) comprising a beta-turn. Analogues with type C-terminal region comprising a beta-turns elicit proinflammatory responses characterised by spasmogenesis, platelet aggregation and neutrophil non-mediated increases of cell membrane (specifically vascular) permeability, or neutrophil polarisation, neutrophil energine release and neutrophil mediated increases in cell membrane (csp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   vascular) permeability, respectively.

The analogues can be used as immune adjuvants for the treatment of immune deficiency disorders, and for augmenting standard immune therapy for the treatment of cancer, without inflammatory side effects. They can also be used to facilitate drug delivery by increasing vascular permeability, e.g. in the treatment of CNS disorders such as Alzheimer's disease or tumours, and to develop high affairty GSa receptor antagonists useful as non-steroidal anti-inflammatory agents.
                                                                                                                                                                                                               C-terminal analogues of C5a anaphylatoxin - induce e.g. spasmogenesis, platelet aggregation and increases in cell membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        In a type (If or V) beta-turn specific human foetal artery smooth mascle contraction assay, and a type III beta-turn specific neutrophil polarisation assay the peptide had respective EC50 (microM) activities of >1000 and 215, compared to 0.018 and 0.0013
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 immune adjuvant; immunodeficiency; augmentation; immune therapy; cancer; frug delivery; CNS disorder; central nervous system; Alzheimer's disease; tumour; high affinity; receptor antagonist; development; non-steroidal; anti-inflammatory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         C5a anaphylatoxin analogue C5a(65-74) Tyr65 Ala70 Pro71 D-Ala73.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                              9
                                                                                                                              response to an immunogen. The molecular adjuvant comprises a targeting response to an immunogen. The molecular adjuvant comprises a targeting response to an immunogen. The molecular adjuvant comprises a targeting ingand, having binding affinity for a characteristic determinant of an antigen presenting cell (APC), the targeting ilgand being functionally linked to the immunogen, and so binding of the molecular adjuvant to the antigen presenting pathway of the molecular adjuvant to antigen presenting pathway of the APC. The present sequence represents a specifically claimed formula for a molecular adjuvant, where the immunogen is serum amyloid A. The molecular adjuvant can be used to produce an immune response for protecting against viral and other pathogens or to produce anti-tumour responses. It can also be used for the production of antibodies for use as immunodiagnostic and immunotherapeutic agents. The molecular adjuvant is readily taken up and processed by APCs to provide APC mediated immune responses. It can provide for the production of antibodies against a weakly-antigenic or

response to an immunogen. The molecular adjuvant comprises a targeting response to an immunogen. The molecular adjuvant comprises a targeting response to an immunogen. The molecular adjuvant comprises a targeting ligand, having binding affinity for a characteristic determinant of an antigen presenting cell (APC), the targeting ligand being functionally linked to the immunogen, and so binding of the molecular adjuvant to the APC determinant activates the APC, effecting delivery of the communogen to an antigen presenting pathway of the APC. The present sequence represents a specifically claimed targeting ligand, which is a C5a C-terminal decapeptide agonist. The molecular adjuvant can be used to to produce an immuno responses for protecting against viral and other pathogens or to produce anti-tumour responses. It can also be used for the production of antibodies for use as immunodiagnostic and immunotherapeutic agents. The molecular adjuvant is readily taken up and immunotherapeutic agents. The molecular adjuvant is readily taken up and provide for the production of antibodies against a weakly-antigenic or non-antigenic substances.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Molecular adjuvant; immune response; immunogen; binding affinity; antigen presenting cell; APC; viral pathogen; anti tumour response; antibody; immunodiagnostic; immunotherapeutic; agonist.

response to an immunogen. The molecular adjuvant comprises a targeting ligand, having binding affinity for a characteristic determinant of an antigen presenting cell (APC), the targeting ligand being functionally linked to the immunogen, and so binding of the molecular adjuvant to the APC determinant activates the APC, effecting delivery of the immunogen to an antigen presenting pathway of the APC. The present sequence, represents a targeting ligand and immunogen, in which the juxta-membrane epitope of imman mucin-1 is positioned toward the carboxyl terminus and the C5a analogue is positioned toward the amino terminus. The molecular adjuvant can be used to produce an immune
                                                                                                                                                                                                                                                response for protecting against viral and other pathogens or to produce anti-tumour responses. It can also be used for the production of antibodies for use as immunodiagnostic and immunotherapeutic agents. The molecular adjuvant is readily taken up and processed by APCs to provide APC-mediated immune responses. It can provide
                                                                A novel molecular adjuvant has been developed for enhancing an immune

response to an immunogen. The molecular adjuvant comprises a targeting ligand, having binding affinity for a characteristic determinant of an antigen presenting cell (APC), the targeting ligand being functionally linked to the immunogen, and so binding of the molecular adjuvant to immunogen to an antigen presenting personting pertenting of the molecular adjuvant to immunogen to an antigen presenting pathway of the APC, effecting delivery of the caquence represents a specifically claimed targeting ligand and immunogen. The molecular adjuvant can be used to produce an immune cresponse for protecting against viral and other pathogens or to produce anti-tumour responses. It can also be used for the production of antibodies for use as immunodiagnostic and immunotherapeutic agents. The molecular adjuvant is readily taken up and processed controlled applyant is readily taken up and processed controlled to provide APC-mediated immune responses. It can provide to the production of antibodies against a weakly-antigenic or

                                                                                                                                                                                                       The present sequence, the human complement C5a derivative 1-64,
ThriMet, Cys27Ser, Asn64Cys, is a C5a receptor antagonist which
Exhibits no agonist activity. It can be used to treat or prevent
C5a mediated diseases or inflammation, e.g. pneumonitis, adult
respiratory distress syndrome (ARDS), pulmonary inflammation or
injury, post myccardial infarction inflammation inflammatory bost myccardial infarction inflammation or
disease, rheumatoid arthritis, psoriasis, endotoxic shock, sepsis,
severe trauma and burns. It can also be used to treat patients
suffering from transplant rejection, receiving immunosuppressive
therapy or massive blood transfusion, exposed to medical devices
or experiencing pulmonary dysfunction following haemodialysis or
leukopheresis. It can also be used as a prophylactic, particularly
c in conditions caused by reperfusion following haemodialysis or
leukopheresis. It can also be used as a prophylactic, particularly
c inconditions caused by reperfusion, e.g. reperfusion following
ischemnia, and circulatory contact with medical devices, as well as
to prevent transplant rejection.
C Antibodies against the derivative can be used to detect or quantify
the derivative and modify, e.g. neutralise, its activity in vivo.
N.B. Sequence not given in specification, but constructed using the
wild type sequence given on pages 51-52.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The present sequence, the human complement C5a derivative 1-65,
ThrlMeL, Cys27Ser, 11e65Cys, is a C5a receptor antagonist which
exhibits no agonist activity. It can be used to treat or prevant
C5a mediated diseases or inflammation, e.g. pneumonitis, adult
respiratory distress syndrome (ARDS), pulmonary inflammation or
injury, post myocardial infarction inflammation, inflammatory bowel
disease, rhemmatoid arthritis, psoriasis, endotoxic shock, sepsis,
severe trauma and burns. It can also be used to treat patients
suffering from transplant rejection, receiving immunosuppressive
therapy or massive blood transfusion, exposed to medical devices
or experiencing pulmonary dysfunction following haemodialysis or
leukopheresis: It can also be used as a prophylactic, particularly
in conditions caused by reperfusion, e.g. reperfusion following
ischaemia, and circulatory contact with medical devices, as well as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           the derivative and modify, e.g. neutralise, its activity in vivo. N.B. Sequence not given in specification, but constructed using the wild type sequence given on pages 51-52.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    transplant rejection. against the derivative can be used to delect or quantify {\bf q}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; complement; CSa; derivative; receptor; antagonist; trauma; treatment; prevention; disease; inflammation; pneumonitis; burn; adult respiratory distress syndrome; ARDS; pulmonary; injury; post myocardial; infarction; inflammatory bowel; endotoxic shock; rheumatorid arthritis; psortasis; sepsis; transplant rejection; immunosuppressive therapy; blood transfusion; dysfunction; haemodialysis; Leukopheresis; prophylaxis; reperfusion.

                                                                                                                                                                                                                                                                                                                                           The present sequence, the human complement C5a derivative 1-66, Thilder, Cys275er. Ser66Cys, is a C5a receptor antagonist which exhibits no agonist activity. It can be used to treat or prevent c5a mediated diseases or inflammation, e.g. pneumonitis, adult respiratory distress syndrome (ARDS), pulmonary inflammation or injury, post myocardial infarction inflammation. Inflammation or injury, post myocardial infarction inflammation, inflammation or injury, post myocardial infarction inflammation, inflammation or injury, post myocardial infarction inflammation from transplant rejection, receiving immunosuppressive suffering from transplant rejection, receiving immunosuppressive therapy or massive blood transfusion, exposed to medical devices or experiencing pulmonary dysfunction following haemodialysis or leukopheresis: it can also be used as prophylactic, particularly in conditions caused by reperfusion, e.g. reperfusion following ischaemia, and circulatory contact with medical devices, as well as the derivative and modify, e.g. neutralise, its activity in vivo. The derivative and modify, e.g. neutralise, its activity in vivo. Will frome sequence not given on ages 51.50
                                                                                                                                                                                                                                                                         New human complement C5a poly-peptide derivs. - used as C5a receptor antagonists, partic. for treating C5a-mediated diseases and inflammatory conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
